

GAMME CUSHION MOSS

Ref. 400180

A moss panel or moss wall by Nature at home is a beautiful, maintenance friendly, natural eye-catcher in every interior. A moss wall is a great alternative for living plants, and provides a decorative “green’ enrichment to every room. In addition, the moss has a strong sound-absorbing effect. The Gamme is a cushion moss that comes from Northern Europe. After harvesting, the moss is treated with glycerine and potentially impregnated with colour, making it permanently soft, elastic, dirt-repellent, and fire-retardant. The moss is processed on MDF sheets of 10 mm thick. The panels are delivered as natural tiles of 50 x 50 cm, or as customised pieces for projects. The panels are for interior use. The Gamme does not need water or daylight. At humidity less than 30%, the moss can dry slightly, causing a reduction in its elasticity. Though, as soon as the humidity rises again, the elasticity recovers. The application possibilities of this moss are never ending!

GAMME CUSHION MOSS

PRODUCT DETAILS

| | |
|---------------|---|
| Main Category | WALL PANELS |
| Material | Bolmoss |
| Color | Mossgreen |
| Structure | organic |
| Dimension | 500 x 500 x 15 mm or customised |
| Weight/panel | 0,750 kg |
| Manufacturing | The Gamme is a cushion moss that comes from Northern Europe. After harvesting, the moss is treated with glycerine and potentially impregnated with colour, making it permanently soft, elastic, dirt-repellent, and fire-retardant. |
| Weight/m2 | 3 kg |
| Process | The processing of the panels is customised. Consult our sales department for additional information. |

MVO / PRODUCTION

Reindeer mosses have hollow branches without marrow, making them look like plants. The lichen lives in a nature reserve of around 300 km², and are harvested under government supervision. This process is completely harmless, and the mosses regrow themselves.

After harvesting, the mosses are collected, cleaned, and naturally treated with a chlorophyll gel or glycerin. This treatment keeps the soft structure of the moss, and ensures that the plant repels dirt and is fire-retardant. The mosses can be coloured by adding natural pigments to the glycerin during the process. This treatment is beneficial because the moss repels insects.

The backings are processed without chemical adhesives, but instead with natural resin. The stabilised moss does not need sunlight, water, or maintenance to preserve its colour and shape. The moss has a lifespan of more than 8 years.
