

STALOLUOKTA FLATMOSS MOSS GREEN

Ref. 400185

A moss panel or moss wall by Nature at home is a beautiful natural, maintenance friendly eye-catcher in every interior. A moss wall is a great alternative for living plants and provides a decorative “green’ enrichment to every room. This moss also has a strong sound-absorbing effect. The Staloluokta is a bacilliform short moss from Northern Europe. After harvesting, the moss is treated with glycerine and potentially impregnated with colour, making it permanently soft, elastic, dirt-repelling, and fire-retardant. The moss is processed on MDF sheets of 10 mm thick. The panels are supplied as natural tiles of 50 x 50 mm or as customised for projects. The panels are for interior use. The Staloluokta does not need water or daylight. At humidity less than 30%, the moss can dry slightly, causing a reduction in its elasticity. Though, as soon as the humidity rises again, the elasticity recovers. The application possibilities this moss are endless!

STALOLUOKTA FLATMOSS MOSS GREEN

PRODUCT DETAILS

Main Category	WALL PANELS
Collection	Tundra moss
Material	Cushion moss
Color	Middle green
Structure	organic
Dimension	500 x 500 x 15 mm
Weight/panel	750 gr
Manufacturing	The Staloluokta is a bacilliform short moss from Northern Europe. After harvesting, the moss is treated with glycerine and potentially impregnated with colour, making it permanently soft, elastic, dirt-repelling, and fire-retardant.
Weight/m2	3,0 kg
Packaging	1,0 m2 / 4 panels
Process	The processing of the panels is customised. Consult our sales department for additional information.
Application area	Interior; straight walls
Maintenance	The moss is dirt-repellent. Cleaning can be done with a cleaning duster.

MVO / PRODUCTION

Reindeer mosses have hollow branches without marrow, making them look like plants. The lichen lives in a nature reserve of around 300 km², and are harvested under government supervision. This process is completely harmless, and the mosses regrow themselves.

After harvesting, the mosses are collected, cleaned, and naturally treated with a chlorophyll gel or glycerin. This treatment keeps the soft structure of the moss, and ensures that the plant repels dirt and is fire-retardant. The mosses can be coloured by adding natural pigments to the glycerin during the process. This treatment is beneficial because the moss repels insects.

The backings are processed without chemical adhesives, but instead with natural resin. The stabilised moss does not need sunlight, water, or maintenance to preserve its colour and shape. The moss has a lifespan of more than 8 years.
